

ENGINEERED SYNTHETIC SLING SOLUTIONS

CORTLAND
INTERNATIONAL™

Lifting Specialists

Cortland lifting slings allow operators to rig and lift in less time, maintaining operational safety and less damage to equipment

When it comes to meeting the demanding technical specifications of larger and more complex lifts, synthetic lifting solutions surpass traditional steel wire slings in strength, weight, handling, and storage efficiency.

As an originator of fiber braiding technology, we bring more than 25 years of experience engineering certified synthetic lifting sling solutions. We are also the only fabricator offering both rope and round sling options, enabling us to deliver the most effective lifting package for each unique application.

Successful lifting solutions start with a deep understanding of the critical aspects of the lift and a precise engineering design. Our process delivers complete, end-to-end support through:

Client Interface Our engineering team partners closely with clients to evaluate lifting requirements and select the most appropriate product, ensuring an optimal solution.

Product Knowledge With extensive expertise in synthetic materials, our engineers understand the full range of mechanical properties, advantages, and limitations of each product we design and manufacture.

Design We have the capability to engineer custom synthetic fiber solutions or adapt existing designs to meet the demands of specialized applications.

Lift Studies Our team conducts comprehensive lift studies and analyses to determine rope or sling requirements and provide complete, turnkey lifting solutions.

Whether your need is lifting and/or lowering lines, tow or recovery solutions, deep water installation slings or slings with high vertical hitch MBL, we can engineer a synthetic solution tailored to your exact specifications.

Fiber vs. Steel

Over the past decade, synthetic high-performance ropes and slings have become a critical component in modern lifting operations, increasingly replacing traditional steel wire rope.

Made from advanced, high-strength fibers, these synthetic solutions are remarkably durable and resistant to rust, corrosion, and water exposure—whether in saltwater or freshwater environments. Wear points can be effectively protected against abrasion, cutting, and heat damage, and the products are both easy to inspect and repair.

Lightweight fiber lifting slings dramatically reduce rigging time and manpower requirements. At up to 86% lighter than steel wire rope, they offer superior flexibility, minimizing handling strain and reducing the risk of rigging-related injuries. Their soft, non-abrasive texture is gentler on hands and protects valuable payloads from damage.

For heavy-lift projects, synthetic lifting solutions also deliver measurable savings in transportation, handling, and storage costs, further enhancing overall efficiency and safety.

Benefits of Fiber vs. Steel:

- Lighter and easier to handle
- Minimal set-up costs
- Faster turnarounds
- Reduced risk of injury
- Reduced total costs
- Low maintenance
- Works well on winches
- Easy to splice

Testing Services

- Max tension/tension and break load 5872kN
- Full capacity testing from 24" (610mm) to 177ft (54m) overall length
- 200HP pump offers full capacity cyclic RAM speed of 44 IPM
- Fully comply with all relevant legislative and internally recognized testing standards

Cortland's synthetic products have been instrumental in enhancing operational efficiency and safety across a wide range of critical lifting operations. To help customers manage the full lifecycle of these products, we work closely with clients to understand long-term usage and retirement criteria.

Inspection and Recertification Services

Cortland offers comprehensive inspection, proof loading, and destruction testing capabilities at our U.S.-based facilities. Our services focus on destructive testing and recertification of synthetic fiber ropes and slings with capacities up to 1.3 million pounds (589 t).

Our test equipment features a 14-foot (4.2 m) stroke, accommodating a broad range of product sizes. In addition to tensile testing, we can perform tension-tension fatigue testing up to full machine capacity, supported by high-fatigue-rated components.

All Cortland synthetic fiber slings comply with key global standards. Each sling is properly tagged, and every process is backed by comprehensive documentation. Engineered and proof-loaded to precise length tolerances, Cortland slings feature secure construction with efficient splice terminations. For added versatility, slings are also available with innovative integrated hardware solutions.

Selantic® slings provide very low elongation, precise length tolerances, and high strength performance

Since 1993, Selantic® slings and interfacing hardware have been trusted by the heavy lift industry as a safe, reliable, cost-effective, and lightweight alternative to traditional chains and wire rope.

Selantic slings are endless-loop grommets constructed from parallel-laid synthetic fibers with a protective jacket over the body and a reinforced jacket in the eye (the eyes are artificial due to the grommet design). These slings can be manufactured as short as one meter while still achieving a 3,000 Te MBL. They are torque-neutral, meaning they resist rotation under load, and if rotation occurs, there is minimal strength loss. Their design also results in virtually no bending stiffness, enabling efficient storage.

Materials are carefully selected to suit your specific application. Core materials include UHMWPE and Aramid fibers such as Technora® and Dyneema®. To protect against chafing and wear, the core is encased in a durable protective cover, ensuring a long-lasting lift solution.

Cortland also provides specialty compliant hardware engineering services, including thimbles, shackles, hooks, and spreader bars, offering a complete, engineered lifting solution.

Specifications:

materials:	Aramid, UHMWPE or blends
construction:	Parallel laid endless loop filaments
jacket:	Cordura® cut resistant cover, and special design wear protection in critical areas
capacity:	1 to >2000 Te MBL
length:	0.8 to 88m
length tolerance:	+/- 0.25% of nominal length and 0.1% between matched pairs
certifications:	DNV, CEN and ILO

For Precision Lifts

Advantages:

- Stiffness optimized slings for each leg
- Ability to produce short lengths
- High strength efficiency, yet lightweight
- Possibilities for project specific bending radiuses
- Small length tolerances
- Protective jacket solutions, offering durability and visibility features
- Industry accepted tagging
- Easy to handle, store, and transport
- Custom design per application, including hardware if necessary

Applications:

- Surface overhead crane lifting (below the hook):
- Wind farm installation; towers, nacelles, monopiles, transition pieces (TP)
 - Industrial material movement or transfer; power turbines, etc.
 - Shipyards
 - Precision lifting
- Subsea Lifting:
- Subsea installation of suction piles, anchors, support structures, manifolds, buoys
 - Load transfer and pull-in operations

Plasma® 12x12 braided construction creates strong lifting slings that are perfect for long length lift situations

Cortland’s Plasma® rope is engineered to be strong enough for the heaviest lifts while remaining durable for repeated use. Our proprietary Plasma technology processes UHMWPE fibers for maximum strength efficiency, which are then braided into a torque-free rope that is both firm and flexible, allowing for the production of very long lengths.

Using the largest 12-strand braider in the world, Cortland can manufacture large-diameter ropes up to 200 mm and exceptionally long lengths. Unlike traditional wire ropes or jacketed round slings, Plasma 12x12 rope slings are easy to inspect, and if repair is required, the construction allows for replacement of individual worn strands.

Plasma 12x12 rope slings are neutrally buoyant and do not absorb water, ensuring that lifting capacity remains consistent even when immersed. Their lightweight design and ease of handling make them especially popular in offshore crane lifting systems.

Specifications:

- | | |
|-------------------|--|
| materials: | Plasma® UHMWPE (other high modulus synthetic fibers available such as Aramid or LCP) |
| construction: | 12x12 torque-free braid |
| chafe protection: | Braided or narrow woven options available |
| capacity: | Nominal diameter sizes up to 200mm |
| | • Eye-to-eye vertical hitch–up to 2233t MBL |
| | • Grommet vertical hitch–up to 3685t MBL |
| length: | Unlimited long lengths – short lengths dependent on size |
| length tolerance: | As low as +/-0.25% of nominal length |
| certifications: | All standards |

For Long Length Lifts

Advantages:

- Long lengths available, no upper length limits
- Lightweight and easy to handle
- Low D:d ratio efficiencies
- High flex fatigue and abrasion resistance
- Easily inspected and repaired
- Protective jacket options ranging in durability and visibility
- Custom design per application, including hardware if necessary

Applications:

- Surface overhead crane lifting (below the hook):
- Wind farm installation; towers, nacelles, monopiles, transition pieces (TP)
 - Industrial material movement or transfer; power turbines, etc.
 - Shipyards
- Offshore and Subsea Lifting:
- Subsea installation of suction piles, anchors, support structures, manifolds, buoys
 - Load transfer and pull-in operations

Selantic® Round Slings

Custom Designed
Each Selantic® sling is custom designed for the intended application.

Core Construction
Selantic slings are endless loop grommets made of a parallel laid synthetic fiber construction.

Protective Covers
The selected core material is encased in a protective cover to ensure a durable and long-lasting lift solution. Heavier wear protection are used in the eyes.

Selantic slings can be made as short as one meter and still achieve >1000 Te MBL.

Selantic slings are torque-neutral, with no tendency to rotate under load (if rotation occurs, little strength loss is experienced).

Specialized Hardware
Cortland International offers specialty compliant hardware engineering services with all products. Thimbles, shackles, hooks and spreader bars can all be custom engineered into the initial sling design.

The below slings are available as standard but each sling is custom-designed and manufactured according to customer’s requirements. They are available in lengths varying from short (0.8m) up to 88m, with different characteristics according to the intended application.

Your Specifications
When ordering, please provide us with as much information as possible to ensure that we provide you with the most cost-effective solution. For example, is heat or chemical resistance an issue? Would it be advantageous for the sling to have a high visibility jacket for subsea applications? Are special friction resistant wear pads required? How will the sling interface with other lifting components? Given this information, we will design, manufacture and deliver exactly the right solution for your needs.

Rope Lifting Slings

Cortland International braided rope slings will outlast and outperform synthetic fiber round slings, standard or high performance.

There are many unique ways to fabricate rope into slings, two common methods are:

- single leg (eye-and-eye)
- endless loop (grommets)

Be sure to select the proper sling strength and fabrication configuration for the application.

All Cortland rope slings are proof loaded to 2x rated capacity.

Correct choice of rope lifting sling requires a good understanding of strength, durability, contact lifting points and other possible factors which could affect the lifting sling. Considerations include:

- Bending fatigue or WLL rated capacity reductions due to connection points (D:d ratios)
- Length tolerances
- Hardware interfaces
- Temperatures greater than 149°F (65°C)

Wear protection can be provided to cover both eye terminations and/or body or portions of the sling body.

Cortland rope slings are manufactured in the USA and tag certified to meet all ASME B30.9 lifting standards (other certification standards met upon request).

Rope Sling Configuration

Just as important as selecting the right fiber and construction, selecting the correct configuration will further enhance the performance of any sling. There are two primary configurations for fiber rope slings:

- Eye and Eye
- Endless Grommet

Each configuration has its own features and benefits.

Eye and Eye Slings

When spliced into an eye and eye sling, UHMWPE will essentially act as a size-for-size replacement for a traditional steel wire rope sling in terms of strength. Each end is terminated using a Cortland-approved splice which becomes locked in place after proof load testing.

Due to the splice length and free span requirements as shown in the drawing below, eye and eye slings have minimum length that must be considered. The sling can be made only so short due to the splices. Refer to minimum sling length column in the Sling Rating charts beginning on page 14.

- Minimum D:d ratio in the eyes is 1:1
- Minimum eye length must be 6x the bearing surface diameter or pin diameter, to maintain the vertex angle below 30°
- Rated capacity of eye-and-eye sling in a vertical pull includes splice efficiencies
- When basketing eye and eye slings the rated capacity will be affected when the basket point D:d ratio is less than 25:1

Endless Grommet Slings

Grommets are manufactured by splicing the ends of a rope together to form a continuous loop. Compared to eye-and-eye slings, they have increased strength with little to no increase in the chosen rope diameter due to two (2) legs holding the load. Alternatively, the same load can be held with a smaller rope diameter due to the two (2) legs holding the load.

The breaking strength of endless grommet slings is directly affected by the pin diameter on which they are mounted.

- Grommet sling rated capacity is directly related to the contact curvature on which it will be used
- Grommet sling ultimate strength is based on applying a configuration factor (CF) to the single leg strength to which the rope is made

Minimum Break Load (MBL) in pounds is determined using spliced test samples in accordance with Cordage Institute 1500-02 - Test Method for Fiber Ropes.

Minimum sling length on Cortland fabricated Eye & Eye slings assumes 1) a compressed minimum eye length of 6.75 times the rope diameter in inches, and 2) a clear span area between splices of 10 times Cortland rope circumference in feet.

The recommended Design Factor (DF) of 5:1 on this chart is based on several existing sling standards including ASME B30.9. This design factor takes into account various factors including the use of Ultra High Molecular Weight Polyethylene (UHMWPE) fiber which is extremely durable and resistant to repeated high loads. Plasma® rope slings have and can be used with different DF ratios: however, this is a decision which must be made by a qualified person in conjunction with the rope manufacturer.

We recommend the use of wear protection around choking points. Please consult Cortland if you require the use of our fiber rope slings in a choker hitch at a lifting angle of less than 120°, following ASME B30.9 guidelines.

Bending Guidance

In theory, a sling used in a basket configuration could have twice the working load as a sling in a vertical configuration because two ropes are now holding the load instead of one. However, the decrease in tensile stress is partially offset by an increase in bending stress. The magnitude of this bending stress is dependent on the size and shape of the contact surface. Users must account for the bending strength loss with an efficiency factor as shown below in the Reduced Basket Capacity Calculation.

The bending efficiency reduces as the D:d ratio is reduced. Example: a 5:1 D:d ratio provides 80% efficiency.

Reduced Basket Capacity Calculation

C = B x e

C = Reduced Basket Capacity due to bending efficiency reduction

B = Rated Basket Capacity with consideration of horizontal sling fleet angle

e = Bending efficiency percentage

Represents a contact surface that is equal to or greater than the rope diameter

Represents a contact surface with a D:d ratio of one or greater. Refer to the Efficiency Table for deductions as needed.

Efficiency Table	
D:d Ratio	eff % (e)
25:1	100.0%
8:1	82.5%
5:1	80.0%
3:1	75.0%
2:1	72.5%
1:1	65.0%

* This MBL includes a 10% reduction due to 55:45% load sharing. Minimum Break Load (MBL) in pounds is determined using spliced test samples in accordance with Cordage Institute 1500-02 - Test Method for Fiber Ropes. Specifications for endless loop (grommet) Plasma® rope slings assume one end-to-end splice. The length of splice determines the minimum length of a grommet sling. The recommended Design Factor (DF) of 5:1 on this chart is based on several existing sling standards including ASME B30.9. This design factor takes into account various factors including the use of Ultra High Molecular Weight Polyethylene (UHMWPE) fiber which is extremely durable and resistant to repeated high loads. Plasma® rope slings have and can be used with different DF ratios: however, this is a decision which must be made by a qualified person in conjunction with the rope manufacturer. Please consult Cortland if you require the use of our fiber rope slings in a choker hitch at a lifting angle of less than 120°, following ASME B30.9 guidelines.

Bending Guidance

In theory, a sling used in a basket configuration could have twice the working load as a sling in a vertical configuration because there are double the number of supporting strands. However, the decrease in tensile stress is partially offset by an increase in bending stress. The magnitude of this bending stress is dependent on the size and shape of the contact surface. Users must account for the bending strength loss with an efficiency factor as shown below in the Reduced Basket Capacity Calculation.

The bending efficiency reduces as the D:d ratio is reduced. Example: a 5:1 D:d ratio provides 97% efficiency.

Minimum Break Load (MBL) in tonnes is determined using spliced test samples in accordance with Cordage Institute 1500-02 - Test Method for Fiber Ropes.
Minimum sling length on Cortland fabricated Eye & Eye slings assumes 1) a compressed minimum eye length of 6.75 times the rope diameter in millimeters, and 2) a clear span area between splices of 10 times Cortland rope circumference in feet.
The recommended Design Factor (DF) of 5:1 on this chart is based on several existing sling standards including ASME B30.9. This design factor takes into account various factors including the use of Ultra High Molecular Weight Polyethylene (UHMWPE) fiber which is extremely durable and resistant to repeated high loads. Plasma® rope slings have and can be used with different DF ratios: however, this is a decision which must be made by a qualified person in conjunction with the rope manufacturer.
We recommend the use of wear protection around choking points. Please consult Cortland if you require the use of our fiber rope slings in a choker hitch at a lifting angle of less than 120°, following ASME B30.9 guidelines.

Bending Guidance

In theory, a sling used in a basket configuration could have twice the working load as a sling in a vertical configuration because two ropes are now holding the load instead of one. However, the decrease in tensile stress is partially offset by an increase in bending stress. The magnitude of this bending stress is dependent on the size and shape of the contact surface. Users must account for the bending strength loss with an efficiency factor as shown below in the Reduced Basket Capacity Calculation.

The bending efficiency reduces as the D:d ratio is reduced. Example: a 5:1 D:d ratio provides 80% efficiency.

* This MBL includes a 10% reduction due to 55:45% load sharing. Minimum Break Load (MBL) in tonnes is determined using spliced test samples in accordance with Cordage Institute 1500-02 - Test Method for Fiber Ropes. Specifications for endless loop (grommet) Plasma® rope slings assume one end-to-end splice. The length of splice determines the minimum length of a grommet sling. The recommended Design Factor (DF) of 5:1 on this chart is based on several existing sling standards including ASME B30.9. This design factor takes into account various factors including the use of Ultra High Molecular Weight Polyethylene (UHMWPE) fiber which is extremely durable and resistant to repeated high loads. Plasma rope slings have and can be used with different DF ratios: however, this is a decision which must be made by a qualified person in conjunction with the rope manufacturer. We recommend the use of wear protection around choking points. Please consult Cortland if you require the use of our fiber rope slings in a choker hitch at a lifting angle of less than 120°, following ASME B30.9 guidelines.

Bending Guidance

In theory, a sling used in a basket configuration could have twice the working load as a sling in a vertical configuration because there are double the number of supporting strands. However, the decrease in tensile stress is partially offset by an increase in bending stress. The magnitude of this bending stress is dependent on the size and shape of the contact surface. Users must account for the bending strength loss with an efficiency factor as shown below in the Reduced Basket Capacity Calculation.

The bending efficiency reduces as the D:d ratio is reduced. Example: a 5:1 D:d ratio provides 97% efficiency.

Reduced Basket Capacity Calculation

C = B x e

C = Reduced Basket Capacity due to bending efficiency reduction

B = Rated Basket Capacity with consideration of horizontal sling fleet angle

e = Bending efficiency percentage

Represents a contact surface with a D:d ratio of one or greater. Refer to the Efficiency Table for deductions as needed.

Efficiency Table	
D:d Ratio	eff % (e)
8:1	100.0%
5:1	97.0%
3:1	91.0%
2:1	88.0%
1:1	79.0%

SRS™ slings from Cortland International feature an endless loop construction (parallel laid endless filaments) of UHMWPE material, enabling these slings to be manufactured with very low elongation under load; and at very high strength. They are available in short lengths, with vertical capacities from 40,000 lbs (18.2Te) to 500,000 lbs (226.8Te); higher capacities are available upon request.

Their lightweight design and equal strength-to-size profile vs. wire rope make these ideal tools for heavy lifts. To protect potential wear areas from abrasion, cutting, or snagging, the core material is encased in a tough protective nylon jacket to ensure a durable and long-lasting lift solution.

Features

- Stronger, safer, and easier to handle than steel
- Lightweight and flexible
- Lengths from 5ft (1.524 m) to 72 ft (22 m); longer lengths available upon request
- Matched slings are easily achieved, +/- 0.25% of nominal length, +/- 0.394 inches (10 mm) between matched sets
- Vertical capacities from 40,000 to 500,000 lbs as standard
- Friendly on painted surfaces or sensitive equipment
- Durable construction
- Repairable or replaceable jacket

All Cortland SRS slings are proof loaded and length verified and supplied with a proof loading certificate; third party witnessing is available upon request.

SRS™ Slings are available as standard, in lengths varying from a short 5 ft (1.524 m) up to 72 ft (22 m); please specify length at time of order. Higher capacities and custom designs are available upon request.

Extender™ Adjustable Slings

When load handling heavy equipment becomes a challenge—especially when lifting loads with differential sling lengths—adjustable high performance synthetic rope slings are ideal tools. Cortland International offers high performance synthetic fiber rope slings in an adjustable form: Extender™ Slings.

Extender Slings have one permanent eye, and one eye that is adjustable, which means it can be tightly sized to fit an application, then lengthened or shortened to fit a different application. A single Extender Sling can solve lifting requirements in a wide variety of situations. This changes a high performance rope sling from a specific-use tool, to one that is adaptable for multiple uses; minimizing the number of lifting slings needed in-stock.

Extender Slings are currently available with standard vertical lifting capacities from 10 to 250 tons. All single leg or multi-leg Extender slings are proof-loaded to 2x WLL (5:1), have less than 1% elongation under WLL, and are properly tagged.

Features and Benefits

- UHMWPE high performance lifting sling
- One permanent eye, one adjustable eye
- Length adjustable, to use in a variety of applications
- Opposing force tightens the adjustable splice, preventing any lengthening of the sling
- Lightweight flexibility for safe and fast rigging
- Minimum length dependent on rope diameter size; no max length limitations
- Easy to inspect
- Durable cut-resistant eye terminations
- Many wear protection options, offering increased protection yet allowing for inspection

Extender™ Slings are adjustable to allow use in a variety of applications; they feature one permanent eye and one adjustable eye

Extender™ slings must only be basketed in the slings’ clear spans and never loaded on a spliced area. Extender slings must never be used in a choker configuration. This MBL includes a 20% reduction from traditional, non-adjustable Plasma Eye and Eye Slings due to efficiency losses in the adjustable splice. Minimum Break Load (MBL) in pounds is determined using spliced test samples in accordance with Cordage Institute 1500-02—Test Method for Fiber Ropes. Specifications for Extender slings assume one fixed eye splice and one adjustable “pass through” splice. The length of the two splices determines the minimum length of the Extender Sling. This design factor takes into account various factors including the use of Ultra High Molecular Weight Polyethylene (UHMWPE) fiber which is extremely durable and resistant to repeated high loads. The recommended Design Factor (DF) of 5:1 on this chart is based on several existing sling standards including ASME B30.9. Extender rope slings have and can be used with different DF ratios: however, this is a decision which must be made by a qualified person in conjunction with the rope manufacturer.

Wear Protection

Wear protection products maximize service life of synthetic slings

Integrated Hardware

Engineered hardware for specific operations

Durability is also an important factor of overall lifting sling cost. With the addition of wear protection gear the useful life of slings can be significantly increased, creating maximum cost efficiency with minimal maintenance. For further details on our protective jacket solutions, refer to our Wear Protection brochure.

SX Wear Protection a braided tubular structure offering 100% protection to the rope.

Cortland Cage combines the lightweight, abrasion resistant, and non-water-absorbing properties of UHMWPE fiber in a braided cover sleeve.

Asgard Wear Protection is made from UHMWPE and PNW fibers in a woven, laminated and PU-coated construction and built in a layered design.

DXC Wear Protection is a tightly braided tubular polyester wear protection sleeve with proprietary marine polyurethane coating for use in extreme applications.

XT Wear Protection is a tightly braided tubular polyester wear protection sleeve with proprietary heavy marine polyurethane coating for use in extreme wear applications. Less flexible than other wear protection options.

PNW Wear Protection is a woven fiber material and the most commonly used protection for abrasion; available in both tubular, and hook-and-clasp options.

To utilize synthetic slings fully, we continue to develop new items of hardware that can interface with our slings, tethers, and rope systems. Some hardware components are specially designed for ROV installation without the need for costly diver intervention. For instance, WLL 100t hooks and slings can be manufactured to a weight of <100Kg, enabling an ROV to handle such a system.

We also offer custom-designed hooks for load transfer operations and pull-in operations, according to client-specific dimensions and capacity requirements. Examples include: hooks, delta plates, plate shackles, and anchor bases.

Features:

- ROV and sling friendly designs
- Variety of latch options
- Project-specific capacities
- Delivered with full design package (structural, corrosion and fatigue)

What can we do for you?

Whatever your particular challenge, Cortland welcomes the opportunity to solve it.

We have the unique experience to help any company lower costs, save time, increase safety and gain far better efficiencies. Our service doesn't end with product delivery. We also provide ongoing technical support and training for everyone involved with operating and maintaining the solution we provide.
